

Strategy and Tactics of Pricing

Target group:

Business leaders interested in the performance of the pricing function and with P&L responsibility in organizations.

Programme overview:

The fact that companies use many different pricing structures is a testament of the importance of pricing for profitability and a competitive growth enhancement. Which price is the best one?

Price determination is a top priority for managers in charge of marketing or product strategies for existing or new products. It is also a key variable for CFOs and managers with profit and loss responsibility who have to forecast and manage impacts of pricing changes on financial results.

In today's competitive and global markets it is essential to both understand, and leverage, the relationship between customer value and the costs and competencies required to deliver value. In addition, rapid changes in technology, abundance of big data, and mobile applications, present new opportunities and challenges for the pricing function in organizations.

Many organizations are transitioning from selling products to selling services and solutions and experimenting with a variety of pricing techniques. Innovations in pricing such as subscription plans, flat rates, freemiums, and two-sided platforms, have become very common. These new business models present a need for organizations to develop new pricing models and performance metrics with competencies to monitor customer value, and success metrics for monetizing innovations.

DAY 1, MORNING
